

Independent Boolean phenotypes under a fixed double perturbation

DDR ON; GSE125449 malignant HCC cells and GSE189903 HCC tumour-region cells

Each value is the fraction of matched asynchronous trials reaching a fixed point with the output ON. Outputs may coexist and need not sum to 100%.  
miR-204-5p OE + GSDME KO is simulated, not an experimental GEO condition; non-converged trials remain in the denominator (Table 26).
